Solar Halo Study: Two Frames, Late Afternoon

Captured minutes apart. Winter sun diffused through patterned cloud.

In reviewing these two images, I perceived the outline of a lion form emerging from the solar halo — angled upward, with one bright segment appearing like an eye. I document these moments not as declarations, but as perceptual events. Light, texture, and contrast frequently assemble into familiar archetypes. The recurrence of eye-like formations within halo patterns continues to interest me. Shared as field documentation of light and pattern recognition.
